

class 13: RNAseq with DESeq2

erica yue hu (a17787225)

background

today we will perform an RNASeq analysis on the effects of dexamethasone (hereafter “dex”), a common steroid, on airway smooth muscle (ASM) cell lines.

Data Import

we need two things for this analysis:

- **countData**: a table with genes as rows and samples / experiments as columns, -
colData: metadata about the columns (i.e. samples) in the main countData object.

```
counts <- read.csv("airway_scaledcounts.csv", row.names=1)
metadata <- read.csv("airway_metadata.csv")
```

```
head(counts)
```

check on metadata counts correspondance

we need to check that the metadata matches the samples in our count data.

```
ncol(counts) == nrow(metadata)
```

```
[1] TRUE
```

```
colnames(counts) == metadata$id
```

```
[1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE TRUE
```

```
all(c(T,T,F,T))
```

```
[1] FALSE
```

Q1. HOW MANY GENES ARE IN THIS DATAASET?

```
nrow(counts)
```

```
[1] 38694
```

Q2. how many “control” samples are in thsi dataset?

```
sum(metadata$dex == "control")
```

```
[1] 4
```

Analysis Plan...

we have 4 replicates per condition (“control” and “treated”). we want to compare the control vs the treated to see which genes expression levels change when we have the drug present.

we will go row by row (gene by gene) and see if the average value in control columns is different than the average value in treated columns

step 1: find which columns in **counts** correspond to “control” samples

step 2: extract and select these columns

step 3: caluclate an average value for each gene (i.e each row)

```
#the indices(i.e positions) that are "control"
control.inds <- metadata$dex == "control"
```

```
#extract/select these "control" columns from counts
control.counts <- counts[,control.inds]
```

```
#calculate the mean for each gene (i.e row)
control.means <- rowMeans(control.counts)
```

##for treated:

```
treated.inds <- metadata$dex=="treated"
```

```
treated.counts <- counts[,treated.inds]
```

```
treated.means <- rowMeans(treated.counts)
```

lets put these two mean values into a new data.frame `meancounts` for easy book-keeping and plotting

```
meancounts <- data.frame(control.means,
                          treated.means)

head(meancounts)
```

	control.means	treated.means
ENSG000000000003	900.75	658.00
ENSG000000000005	0.00	0.00
ENSG000000000419	520.50	546.00
ENSG000000000457	339.75	316.50
ENSG000000000460	97.25	78.75
ENSG000000000938	0.75	0.00

Q: make ggplot of average counts of control vs treated

```
library(ggplot2)
ggplot(meancounts, aes(x=control.means,y=treated.means))+
  geom_point(alpha=0.3)
```

this needs to be log transformed as it is so highly skewed:

```
library(ggplot2)
ggplot(meancounts, aes(x=control.means,y=treated.means))+
  geom_point(alpha=0.3)+
  scale_x_log10()+
  scale_y_log10()
```

Warning in scale_x_log10(): log-10 transformation introduced infinite values.

Warning in scale_y_log10(): log-10 transformation introduced infinite values.

log2 units and fold change

if we consider “treated”/“control” counts we will get a number that tells us the change.

```
log2(20/20)
```

```
[1] 0
```

```
# a doubling in the treated vs control
log2(2)
```

```
[1] 1
```

```
log2(10/20)
```

```
[1] -1
```

Q. add a new column `log2fc` for log2 fold change of treated and control to our `meancounts` object

```

meancounts$log2fc <-
  log2(meancounts$treated.means/
        meancounts$control.means)

head(meancounts)

```

	control.means	treated.means	log2fc
ENSG000000000003	900.75	658.00	-0.45303916
ENSG000000000005	0.00	0.00	NaN
ENSG0000000000419	520.50	546.00	0.06900279
ENSG0000000000457	339.75	316.50	-0.10226805
ENSG0000000000460	97.25	78.75	-0.30441833
ENSG0000000000938	0.75	0.00	-Inf

remove zero count genes

typically we would not consider zero count genes - as we have no data about them and they should be excluded from further consideration. these lead to “funky” log2 fold change values (e.g divide by zero errors)

##DESeq analysis

we are missing any measure of significance from the work we have so far. lets do this properly with the **DESeq2** package

```
library(DESeq2)
```

the DESeq2 package, like many bioconductor packages, wants it's input in a very specific way - a data structure setup with all the info it needs for the calculation

```

dds <- DESeqDataSetFromMatrix(countData= counts,
                              colData = metadata,
                              design = ~dex)

```

converting counts to integer mode

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

The main function in this package is called `DESeq()` it will run the full analysis for us on our `dds` input object:

```
dds <- DESeq(dds)
```

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing

extract our results:

```
res <- results(dds)
head(res)
```

Volcano plot

a useful summary figure of our results is often called a volcano plot. it is basically a plot of log2 fold change values vs Adjusted P values

Q. use ggplot to make a first version of “volcano plot” of log2FoldChange vs padj

```
ggplot(res, aes(log2FoldChange, padj))+  
  geom_point()
```

Warning: Removed 23549 rows containing missing values or values outside the scale range (`geom\_point()`).

this is not very useful because the y-axis (P-value) is not really helpful - we want to focus on the low p value.

```
ggplot(res, aes(log2FoldChange,  
                log(padj)))+  
  geom_point()
```

Warning: Removed 23549 rows containing missing values or values outside the scale range (`geom\_point()`).

```
ggplot(res, aes(log2FoldChange,  
                -log(padj)))+  
  geom_point()
```

Warning: Removed 23549 rows containing missing values or values outside the scale range (`geom\_point()`).

each dot is a gene if it is away from 0 in positive direction, it means the expression is going up one of the exploding point means p value is small so it is significant

```
ggplot(res, aes(log2FoldChange,  
                -log(padj)))+  
  geom_point()+  
  geom_vline(xintercept = c(-2,+2), col="red")+  
  geom_hline(yintercept = -log(0.05), col="red")
```

Warning: Removed 23549 rows containing missing values or values outside the scale range (`geom\_point()`).

add some plot annotation

Q: add color to the points (genes) we care about, nice axis labels, a useful title, and a nice theme.

```
mycols <- rep("gray", nrow(res))
mycols[res$log2FoldChange > 2 ] <- "blue"
mycols[res$log2FoldChange < -2] <- "green"
mycols[res$padj >= 0.05] <- "gray"
```

```
ggplot(res)+
  aes(x=log2FoldChange,
      y=-log(padj)) +
  geom_point(col = mycols)+
  geom_vline(xintercept = c(-2,+2), col="red")+
  geom_hline(yintercept = -log(0.05), col="red")
```

Warning: Removed 23549 rows containing missing values or values outside the scale range (`geom\_point()`).

save our results to a CSV file

```
write.csv(res, file="results.csv")
```

add annotation data

to make sense of our results we need to know what the differentially expressed genes are and what biological pathways and process they are involved in.

```
head(res)
```

Let's start by mapping our ENSEMBLE ids to the more conventional gene SYMBOL

we will use two bioconductor packages for this "mapping" **AnnotationDbi** and **org.Hs.eg.db**

we will need to install these from bioconductor with `BiocManager::install("AnnotationDbi")`

```
library(AnnotationDbi)
library(org.Hs.eg.db)
```

```

##pathway analysis

now we know the gene names (gene symbols) and their entrez IDs we can find out what pathways they are involved in. this is called “pathway analysis” or “gene set enrichment” we will use the **gage** package and the **pathviewr** package to do this analysis (but there are loads of others).

```
library(gage)
library(gageData)
library(pathview)
```

let’s see what is in gageData, specifically KEGG pathways

```
data(kegg.sets.hs)
head(kegg.sets.hs, 2)
```

```

[49] "8824" "8833" "9" "978"
```

to run our pathway analysis we will use the **gage()** function. it wants to maintain inputs: a vector of importance (in our case the log2 fold change values); and the gene sets to check overlap for.

```
foldchanges <- res$log2FoldChange
names(foldchanges) <- res$symbol
foldchanges

let's make a figure of these pathways with our DEGs highlighted:

```
pathview(foldchanges, pathway.id = "hsa05310")
```

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/ericayuehu/Desktop/bimm 143/class13

Info: Writing image file hsa05310.pathview.png

Q. generate and insert a pathway figure for “graft-versus-host disease” and “Type I diabetes”?

```
pathview(foldchanges, pathway.id = "hsa05332")
```

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/ericayuehu/Desktop/bimm 143/class13

Info: Writing image file hsa05332.pathview.png

```
pathview(foldchanges, pathway.id = "hsa04940")
```

'select()' returned 1:1 mapping between keys and columns
